Crumbs World — Test Group Release Runbook

v1.0 — 2026-10-14 — Wren

Do PRE-RELEASE top to bottom on Harley. Don't skip the order. POST-RELEASE starts once testers have the files.

PRE-RELEASE

1. Get the patch onto Harley

Download `crumbs-world-launchers-kit.zip` (Wren's latest) on Harley and unzip it. You need this file out of it:

```
crumbs-world-launchers\crumbs-world-rename.patch
```

Put it somewhere easy, e.g. your Downloads folder.

2. Apply the in-game rename

PowerShell (not admin needed):

```
cd C:\Users\lloyd\OneDrive\Desktop\Vault\crumbs-world

git pull

git apply --check --ignore-whitespace "$env:USERPROFILE\Downloads\crumbs-world-rename.patch"
```

If that prints nothing, the patch is clean — apply it:

```
git apply --ignore-whitespace "$env:USERPROFILE\Downloads\crumbs-world-rename.patch"

git commit -am "in-game rename: Crumbs HUD -> Crumbs World"

git push
```

If `git apply --check` complains, STOP and send Wren the error — don't force it.

3. Start the game server on Harley

```
cd C:\Users\lloyd\OneDrive\Desktop\Vault\crumbs-world

.\boots\crumbs-boot.ps1
```

Wait for it to report healthy, then verify in the same shell:

```
curl.exe http://127.0.0.1:8778/api/health
```

You should get `{"ok": true, "version": ...}` back.

Then open `http://127.0.0.1:8778` in Harley's browser and confirm:

- the tab and header say **Crumbs World** (not HUD)
- the login screen shows
- a map loads

4. Open Harley to the internet (Tailscale Funnel)

```
tailscale funnel status
```

If it's not already serving the game, run:

```
tailscale funnel --bg http://127.0.0.1:8778
```

Copy the `https://` URL it gives you. Test it from your **phone** (turn wifi off so it goes over cell data — that proves it's truly public).

5. Hand Wren the URL

Send Wren the Funnel `https://` address. She re-cuts both launchers with the real address baked in (APK rebuild + new mobileconfig) — minutes, not hours.

6. Your own sanity check (before any tester sees it)

On your phone, open the Funnel URL directly in the browser:

- game loads, title says Crumbs World
- log in works, session persists after reload
- paint a tile, save, reload — still there

If anything here fails, fix it BEFORE step 7. Testers should never see your debugging.

POST-RELEASE (testers have the files)

7. Send the launchers

Android testers — send `crumbs-world-launcher.apk`:

> Open the file on your phone, allow "install unknown apps" once when it asks, tap Install, then open "Crumbs World". It connects by itself.

iPhone testers — send `CrumbsWorld.mobileconfig`:

> Open the file, go to Settings → Profile Downloaded → Install. (The "Unverified Profile" warning is normal.) A Crumbs World icon appears on your Home Screen — tap it, the game opens and connects by itself.

8. What to ask testers to report

Free play first — then specifically:

- any blank/black screen (when? what were you doing?)
- login not sticking across app restarts
- portals/interiors not working
- anything that looks broken or confusing

For your dedicated tester (your brother): hand him the 40-check playtest checklist — it's `playtest-v561-checklist.md` in the repo.

9. Watch Harley while they play

Health anytime:

```
curl.exe http://127.0.0.1:8778/api/health
```

Logs live next to the game dir (see `crumbs-boot.ps1` output for the path). If the server dies, re-run `.\boots\crumbs-boot.ps1`.

10. Shipping a fix mid-playtest

Game changes (the usual case): commit, push, then on Harley:

```
cd C:\Users\lloyd\OneDrive\Desktop\Vault\crumbs-world
```

```
git pull
```

Restart the server (`.\boots\crumbs-boot.ps1`). Players get the fix on their next launch automatically — no reinstall.

Launcher changes (rare — only if the wrapper itself changes): bump `CRUMBS_LAUNCHER_ANDROID` in the server env, drop the new APK where `CRUMBS_LAUNCHER_APK_URL` points. Players get an update prompt on next launch. iPhone needs nothing — the web clip just opens the URL.

11. Replit — your call

The Replit deployment is still the only other live copy. Once Harley is verified serving testers fine, you can shut the Replit deployment down so there's exactly one home. Don't do it before that — kill it early and there's no game at all if Harley hiccups. Tell Wren when you want it gone.

Quick reference

What	Where
Game dir (Harley)	`C:\Users\lloyd\OneDrive\Desktop\Vault\crumbs-world`
Boot script	`.\boots\crumbs-boot.ps1`
Local health	`http://127.0.0.1:8778/api/health`
Launcher version	`http://127.0.0.1:8778/api/launcher-version`
Rename patch	in the launchers kit zip
Checklist	`playtest-v561-checklist.md` in the repo
